

Lepore Factorization nr.88

Part I

If $N=4*G+3 \rightarrow N1=N ; N2=5*N$

If $N=4*G+1 \rightarrow N1=3*N ; N2=3*5*N$

If $(N1-3) \bmod 8 == 0 \rightarrow N=N1$

else if $(N2-3) \bmod 8 == 0 \rightarrow N=N2$

$$(N-3)/8-q*(p-A)/8-[4-(A-7)*(A-5)/8]=A*(q+A-4-8)/8$$

\rightarrow

$$N=p*q$$

if we choose A such that $p-A \bmod 8 = 0$ and we choose A of the same size order as q with $A < q$

we can write it this way

$$(N-3)/8-Q-[4-(A-7)*(A-5)/8]=A*X$$

so there are 4 chances to find A and they are

$$8*h+1 ; 8*h+3 ; 8*h+5 ; 8*h+7$$

$$(N-3)/8-p*(q-B)/8-[4-(B-7)*(B-5)/8]=B*(p+B-4-8)/8$$

\rightarrow

$$N=p*q$$

if we choose B such that $q-B \bmod 8 = 0$ and we choose B of the same size order as p with $B < p$

we can write it this way

$$(N-3)/8-P-[4-(B-7)*(B-5)/8]=B*Y$$

so there are 4 chances to find B and they are

$$8*k+1 ; 8*k+3 ; 8*k+5 ; 8*k+7$$

$f(N,A,B)$ is $O(16)$

Example

$$1763=41*43$$

$$220-q*(p-25)/8-[4-(25-7)*(25-5)/8]=25*(q+25-4-8)/8$$

$$220-p*(q-27)/8-[4-(27-7)*(27-5)/8]=27*(p+27-4-8)/8$$

$$220-Q-[4-(25-7)*(25-5)/8]=25*X$$

$$220-P-[4-(27-7)*(27-5)/8]=27*X$$

$$Q=25*y+11 \quad X=10-y$$

$$P=27*x+1 \quad X=10-x$$

$$\text{solve } Q=q*(p-25)/8=25*y+11, p*q=1763$$

$$\rightarrow q=67-8*y$$

$$\text{solve } p*(q-27)/8=27*x+1, p*q=1763$$

$$\rightarrow p=65-8*x$$

Part II

So we will have $Q=(c1)*y+(c2)$ and $P=(c3)*x+(c4)$

bruteforce $8 < X \leq 192$

bruteforce $a > 0$

on

$$a*(c1)*(c3)+(c2)*(c4)*b-x*1763=X$$

linear combination is

$$a*Q+P+b*q*p=W$$

coefficients modulo N

and $W=2*N$ or $W=3*N$

Example

bruteforce $8 < X \leq 192$

bruteforce $a > 0$

on

$$a \cdot 25 \cdot 27 + 8 \cdot 8 \cdot b - x \cdot 1763 = X$$

for example $a=1$ and $X=84 \rightarrow b=1763 \cdot n + 1010$

linear combination is

$$a \cdot (25 \cdot y + 11) \cdot (27 \cdot x + 1) + b \cdot (65 - 8 \cdot x) \cdot (67 - 8 \cdot y) = W$$

$$1 \cdot (25 \cdot y + 11) \cdot (27 \cdot x + 1) + 1010 \cdot (65 - 8 \cdot x) \cdot (67 - 8 \cdot y) = W$$

$$65315 \cdot x \cdot y - 541063 \cdot x - 525175 \cdot y + 4398561 = W$$

coefficients modulo 1763

$$84 \cdot x \cdot y + 178 \cdot x + 199 \cdot y + 1639 = 2 \cdot 1763$$

$$84 \cdot x \cdot y + 178 \cdot x + 199 \cdot y + 1639 = 2 \cdot 1763$$

$$(65 - 8 \cdot x) \cdot (67 - 8 \cdot y) = 1763$$

$$\rightarrow x=3; y=3 \rightarrow p=41 : q=43$$
